EDUCATION

BACHELOR OF COMPUTER SCIENCE

2024 – 2027

SENECA POLYTECHNIC, ONTARIO, CANADA

TECHNICAL SKILLS

Languages: Python, C#, C/C++, JavaScript/Typescript, HTML/CSS, SQL, Linux(Bash)

Frameworks: Flask, React, Node.js, MongoDB, Flutter, PyTorch, Angular, Unittest

Developer Tools: Git, GitHub, Google Cloud, AWS, IntelliJ Idea, VS Code, Visual Studio, MySQL, MongoDB, Figma

Libraries: NumPy, Pandas, Matplotlib, Requests, jQuery, Argparse, Regex

Productivity Software: Microsoft office package (Word, Excel, PowerPoint)

EXPERIENCE

PROCUREMENT ANALYST

08/2025 – Present

BROWNS SHOES, TORONTO, ONTARIO

- Manage purchase orders and replenishment, coordinating logistics to maintain healthy DC stock.
- Conduct cycle counts and resolve stock variances to improve inventory accuracy.
- Maintain SKU master data and process stock updates in SAP to keep item and inventory records current.

ENGINEERING OUTREACH ASSISTANT

09/2023 – 10/2023

ONTARIO TECH UNIVERSITY, OSHAWA, ONTARIO

- Collaborated on running a Tinkercad workshop for grade 7 – 8 students.
- Provided technical support for AV systems during lectures and events, assisting coordinators with setup, troubleshooting, and operation of audio-visual equipment.
- Worked under the engineering faculty's media team, creating stem content.

PROJECTS

Spam Filter Email Agent & BFS Puzzle Solver | *Python, Unittest, Email/MIME*

09/2026

- Built a rule-based spam filter agent in Python that parses .eml files and sorts each email into spam or regular mail folders using allow/restrict domain lists and a bad-word threshold.
- Formulated the 12/8/3-gallon water jug puzzle as a state-space search problem and implemented breadth-first search with duplicate-state detection, finding the shortest 3-step solution among 314 reachable states.
- Wrote 102 automated unit and end-to-end tests with unittest, covering edge cases such as spoofed sender addresses, encoded email bodies, threshold boundaries, and unsolvable puzzle configurations.

Smart Home MQTT Dashboard | *HTML/CSS, JavaScript, Python, MQTT, Mosquitto*

01/2026

- Built a software-based IoT smart home simulation and three Python publisher scripts that simulate real-time temperature, humidity, and motion sensor data to a central message broker.
- Developed a live subscriber dashboard that asynchronously receives and automatically updates displays all sensor readings.
- Configured a local server to route all messages between the sensors and the dashboard, and set up the motion sensor to always show its last known status to any new connection instantly.

Multiplayer Hangman Game | *Python, Json, Socket*

03/2025

- Built a networked version of the classic Hangman game that allows multiple players to play together over a network. One player acts as the host (word chooser) and the others as the guessers.
- Built a category-based word selection system with 5 different themes (Animals, Countries, Food, People Names, All Words).
- Implemented real-time game state synchronization between players, including turn management player status updates, disconnection handling and game termination.
